

# Airborne Wind Measurements in ATReC

Andreas Dörnbrack, Stephan Rahm, Rudolf Simmet,  
Martin Weissmann, Oliver Reitebuch, Reinhold Busen, and Ulrich Schumann  
DLR Oberpfaffenhofen

# Remarks related to COPS

Improve QPF ~ THORPEX goal to improve NWP by getting better initial data fields, e.g. through targeting observations

- do they really get better predictions? (predictability issue; targeting vs. denser remote-sensing data network)
- significant difference to case studies in the organisation and planning of this component during the field campaign!!

Contribution to get „real-time“ assimilation of remote sensing data as (wind, water vapor) LIDAR profiles

- challenging technical issue
- in line with ADM and other satellite missions

# Atlantic THORPEX Regional Campaign (ATReC)

Research/Operational field demonstration of THORPEX components designed to test

- Process of consultation/case selection
- Ability to adaptively control observations
- Assessment of benefits of targeted observations
- Focussed on short range 24-72 h
- Period: October - December 2003

# Atlantic THORPEX Regional Campaign ( ATReC )

## DLR Beitrag

*Targeted wind observations during the North Atlantic TOST 2003*

“The objective is to demonstrate the utility  
of targeted wind observations in predicted sensitive areas  
using an airborne wind lidar and dropsondes.”

EUCOS: 100 000 €

Total: ~150 000 €

# Deep convection in the Irminger Sea forced by the Greenland tip jet

Robert S. Pickart\*, Michael A. Spall\*, Mads Hvid Ribergaard†, G. W. K. Moore‡ & Ralph F. Milliff§

Open-ocean deep convection, one of the processes by which deep waters of the world's oceans are formed, is restricted to a small number of locations (for example, the Mediterranean and Labrador seas). Recently, the southwest Irminger Sea has been suggested as an additional location for open-ocean deep convection. The deep water formed in the Irminger Sea has the characteristic temperature and salinity of the water mass that fills the mid-depth North Atlantic Ocean, which had been believed to be formed entirely in the Labrador basin. Here we show that the most likely cause of the convection in the Irminger Sea is a low-level atmospheric jet known as the Greenland tip jet, which forms periodically in the lee of Cape Farewell, Greenland, and is associated with elevated heat flux and strong wind stress curl. Using a history of tip-jet events derived from meteorological land station data and a regional oceanic numerical model, we demonstrate that deep convection can occur in this region when the North Atlantic Oscillation Index is high, which is consistent with observations. This mechanism of convection in the Irminger Sea differs significantly from those known to operate in the Labrador and Mediterranean seas.

# RESULTS

First DLR Falcon targeting mission

Dropsonde data transmitted in near real time into GTS

- data were transferred via DLR/ECMWF/UK MetOffice
- for future missions setup of direct transfer via DWD

Comprehensive data set of wind lidar and dropsonde data

- data assimilation studies (ECMWF, ADM)
- ENVISAT SAR validation
- case studies (tip jet)

Looking forward to  
further targeting missions with

Dropsondes + in-situ data

$2\mu\text{m}$  Doppler wind lidar +  
Water vapor DIAL

During COPS
