

Characterization of mixed-phase clouds – description of ATR42 aircraft measurement within the COPS campaign

Y.Dufournet (aircraft PI), H. W. J. Russchenberg

Delft University of Technology, The Netherlands.

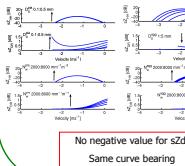

EUFAR activity - Principle

> Name of the project : OSMOC (Observation strategy for Mixed-phase Orographic Clouds) part of EUFAR⁽¹⁾ activities

> Main goal : Study of the microphysical properties of mixed-phase clouds (ice cloud with supercooled water layer embedded) within mid-level non-precipitating clouds during the COPS campaign using a synergy of remote-sensing and in-situ devices.

> General overview :

Sensitivity analysis of the model

No negative value for s_{D0}
Same curve bearing

Particle characterization

shape → relative permittivity

shape → terminal fall velocity

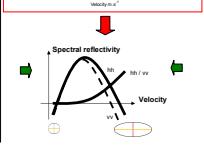

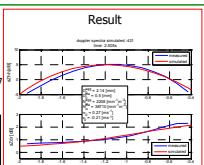

Distribution characterization

$N(D) = N_0 f(D) \exp(-3.67 + \mu \frac{D}{D_0})$

$f(D) = 6 \cdot (3.67 + \mu)^{-1} \cdot (1 + 4)$

> Distribution of the particle orientation

Microphysical model⁽²⁾

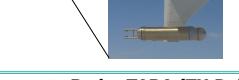

No negative value for s_{D0}
Same curve bearing

Instruments

ATR42 (SAFIRE(2))

Other ground-based measurements:

> Instruments:

basic avionic devices

chemistry probe

Gerber and king probe

FSSP100

2 PMS 2D-C probes (oriented 90°)

!! One of the PMS 2D-C probe didn't work

during the campaign !!

positioning measurements (lat, long, altitude)

meteorological measurement (T, P, H)

aerosols chemistry

LWC

droplet size distribution

Ice crystal distribution + 'shape' + particles orientation

(processed in collaboration with C. DUROURIE - LAMP)

> Data format:

- Quicklooks (Netcdf) : 1 Hz

- data : 10 Hz

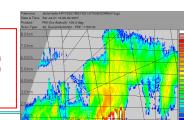

> Quality check:

Validation of the 2D-C data with

Poldirad (along the first ascent leg)

> Validation of the wind with

triangular shape

> Characteristics during microphysical measurements:

- Radar frequency : S band (3.3 GHz) → not sensitive to supercooled water droplets

- antenna : tilted at 45° towards the M supersite (116° N)

- maximum range : 7.5 km (5.3 km in altitude)

- range resolution : 15 m

- polarization : sequence VV VH HH changing every 1 ms (H : Horizontal, V : Vertical)

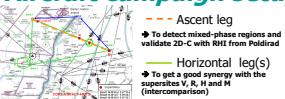

> Interferences within the supersite H

> Quality check using polarimetry:

→ Calibration using Zdr value

→ Clutter filtering using sldr and dealiasing technique⁽³⁾

Aircraft campaign setup

> Main setup :

- 10 flight hours allocated by EUFAR (European Fleet for Airborne Research)
- 5 flights performed following the same flight pattern (21/07 - 23/07 - 24/07 - 28/07 / 2 times)
- meteorological condition required: presence of mixed-phase region (mid-level clouds below 0°C temperature level)

21/07

Rimed particle (collision of ice crystal and drops) → mixed-phase region!

Direct comparison between Tara data and in-situ measurements

Orographic effect ?

23/07

'Golden day' in term of mixed-phase region

Seeding of pristine plates from cloud above ?

Plenty of long columns (needles?) - 1 mm

Frontal activity dominating

No TARA data due to a technical failure

24/07

High rugosity exponent → rimed particles → mixed-phase region

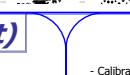

Frontal activity dominating

No TARA data due to a technical failure

28/07 (first flight)

Only water clouds → no ice crystal

1st and 2nd flights not interested for the EUFAR activity

Data required

- Calibrated PSD from the PMS 2D-C probe → used for validation of the products retrieved with the technique

- Calibrated in-situ data.

- In-situ data from the 29/08/07 (from the BAE146)

→ used to increase the data amount in order to get a better statistical evaluation of the retrieval technique (when presence of columns for example)

> Within the next months:

- with the first highlights : improvement of the model for cases which are not working yet + development of an automatic detection of mixed-phase region

- when receiving calibrated in-situ data: comparison of the PSD retrieved with the technique and measured with in-situ data

- with BAE146 : work on the radar – in-situ data relation for other meteorological situation

> later:

- use of other ground-based instruments to better validate the retrieval technique and work on a LWC retrieval technique using Lidar measurements
